LeaveBy

A transition planner for workouts before class or work

Harvey Chowdhury

MTEC 3200 / Project 1

The gym-to-class transition

The workout ends around 8:30 AM. Class begins at 10:00 AM.

Required time Showering, changing and travel still need to fit.

Uncertainty Equipment waits, locker rooms and transit can consume the buffer.

Focus: one recurring transition

Three interview perspectives

Chris	Longer train commute. Equipment and transit delays can stack.
David	Short, predictable walk. Usually has more buffer and feels less rushed.
Selina	Preparation time varies. A fixed work start creates clock watching.

What the research suggests

Transition time Preparation and travel need explicit space before the commitment.

Different routines Commute reliability and buffer change the pressure.

Existing boundaries Hard stops and warning alarms already help participants decide when to stop.

User and point of view

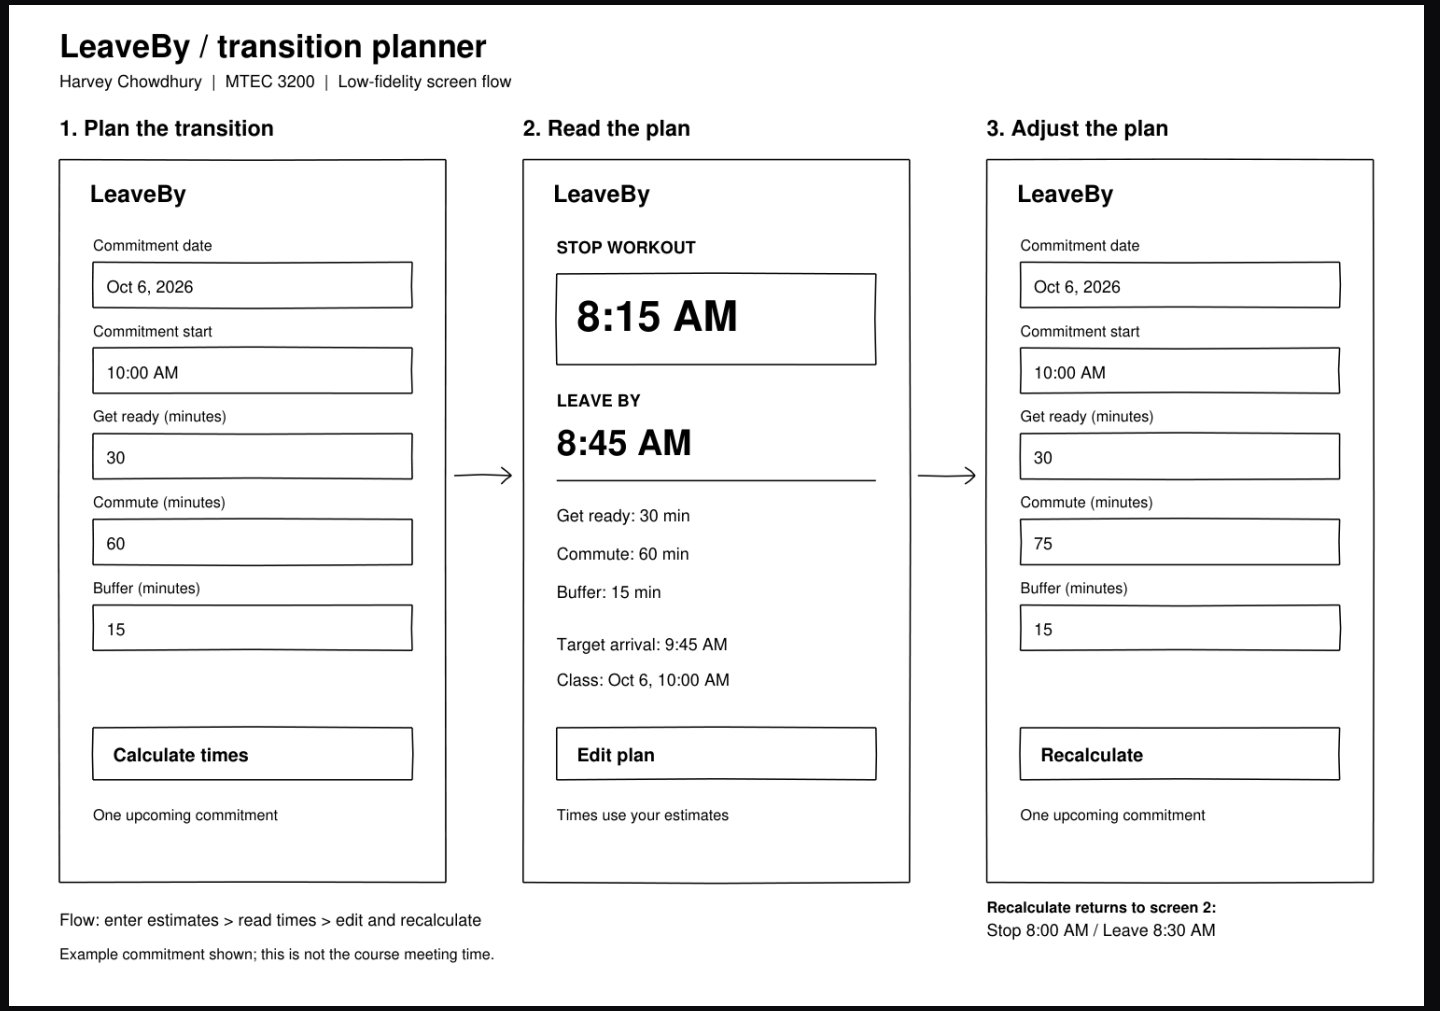

A student or working commuter exercises before a fixed commitment.

Need

A clear boundary between workout time and transition time

Unexpected waits can consume a small buffer and force the person to shorten the routine or rush.

Three states, one plan

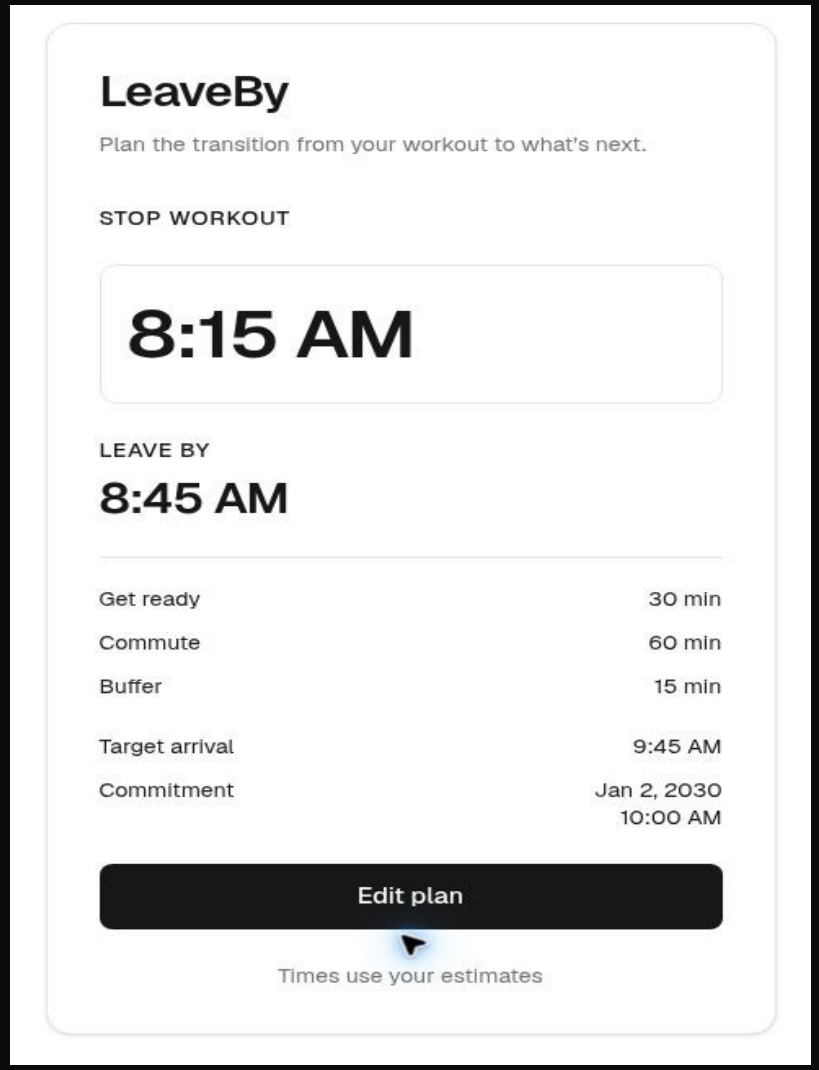

A working prototype

10:00 AM commitment

30 min preparation
60 min commute
15 min buffer

Stop 8:15 AM
Leave 8:45 AM
Arrive 9:45 AM

Working backward from a deadline

Arrival	Commitment minus buffer
Departure	Arrival minus commute
Workout stop	Departure minus preparation

Buffer is deducted once. Full timestamps preserve dates.

Verification and recovery

Calculation	Eight acceptance tests cover arithmetic and edge cases.
Recovery	Errors identify fields, preserve input and move focus.
Hosted flow	Calculate, edit and recalculate work on the deployed app.

Peer usability feedback is still pending.

Limits and the next evaluation

One commitment at a time. Times depend on the entered estimates. Reload starts a new plan.

Next evaluation	Can another person explain Stop workout versus Leave by and edit a plan without help?
